Infant Survival Swim Program - ADA Reimbursement Form

Program Overview and Justification for Reimbursement

The Infant Survival Swim Program is designed to equip young children, including those with autism, with the skills to self-rescue in aquatic emergencies. Our personalized program is tailored to each child's developmental needs, incorporating sensory-aware techniques and calm, structured instruction.

This program is particularly beneficial for children with autism, as it complements existing therapies such as ABA and OT by reinforcing body awareness, confidence, and routine-based learning. Lessons are one-on-one and are delivered by trained professionals who understand the specific needs of neurodiverse children.

Our approach is not only therapeutic but also life-saving. Drowning is the #1 cause of death for children ages 0-4, and is now also the leading cause of accidental death among children with autism ages 0-14.

We guarantee each child receives the time, patience, and individualized attention necessary to master the self-rescue skills that could one day save their life. We encourage regional centers and healthcare programs to consider this as a vital complement to other early intervention services.
